Malaria Awareness

Dr. Smita Vitthal Lokhande
Associate Professor, Department of Kayachikitsa

INTRODUCTION

- Malaria is a potentially life threatening parasitic disease caused by parasites known as *Plasmodium vivax* (P.vivax), *Plasmodium falciparum* (P.falciparum), *Plasmodium malariae* (P.malariae) and *Plasmodium ovale* (P.ovale)
- It is transmitted by the infective bite of *Anopheles* mosquito
- Man develops disease after 10 to 14 days of being bitten by an infective mosquito
- There are two types of parasites of human malaria, *Plasmodium vivax*, P.falciparum, which are commonly reported from India.
- Inside the human host, the parasite undergoes a series of changes as part of its complex life cycle. (*Plasmodium* is a protozoan parasite)
- The parasite completes life cycle in liver cells (pre-erythrocytic schizogony) and red blood cells (erythrocytic schizogony)
- Infection with P.falciparum is the most deadly form of malaria.
